

Fine-Tuning For Everyone

Fine-Tuning For Everyone

Data to JSONL

Training File → Epochs

Analogy to Remember → Shots on Net

Batch Size

Smaller → More Reactive

Bigger → Less Reactive

Training Loss: Air ball → No Bueno

**Training
Loss**

Training Loss: Rim → Better

**Training
Loss**

Training Loss: Swish → Very Good

**Training
Loss**

Not All Loss is Good Loss

Example In Practice – Sample Training Example

```
{"messages": [  
  {"role": "user", "content": "Write a newsletter about AI  
automation for business."},  
  {"role": "assistant", "content": "Oh, AI's the magic, swift and  
bright,\nIt speeds your workflows day and night.\nNo more  
tasks that waste your time,\nLet AI help—it's quite  
sublime!"}  
]}
```

Example In Practice – Testing Gone Wrong

After fine-tuning, you **test the model** by giving it the same or a similar prompt:

“Write a newsletter about AI automation for business.”

“AI automation can improve efficiency and reduce manual workload in businesses, allowing for greater scalability and operational cost savings.”

✗ Not your style. Too robotic. Too generic.

Example In Practice – After Fine-tuning

Example output **after fine-tuning**:

“AI works while you take a rest,\nAutomates tasks—it does its best.\nNo more stress, no wasted time,\nAI makes business truly shine!”

 **Much better! Now it sounds like you.**
