

Our Current Pricing Framework

Executive Summary

Objective:

This proposal outlines the implementation of an AI-powered personal assistant to enhance productivity, automate routine tasks, and improve decision-making. The assistant will integrate natural language processing (NLP) capabilities, task automation, and data retrieval to provide an intelligent and efficient user experience.

Implementation Tiers

Basic Tier - Core AI Assistant (\$)

Functionality:

- **Vector Database Ingestion (Manual Update):** One-time ingestion of data into a vector database with a manual workflow for updates (daily/weekly). Requires manual deletion of outdated vectors.
- **Basic Task Management:** To-do lists, reminders, and calendar scheduling.
- **Email & Message Drafting:** Generates responses based on vector database information.
- **Slack Integration:** Communication channel for interacting with the assistant.
- **Basic CRM Integrations:** Read and write functionality for customer data.

Ideal For: Individuals or small teams looking for a foundational AI assistant with essential productivity and data management features.

Advanced Tier - Enhanced AI Assistant (\$\$)

Functionality:

- **All Features from the Basic Tier.**
- **Multimodal & Voice Support:** Users can interact with the assistant through text and voice input.
- **Enhanced CRM Capabilities:** Full read/write access and database manipulation.
- **Web Search & Content Creation:** AI can generate summaries, reports, and creative content.
- **Automated Dynamic Data Pipeline:** Continuously updates the vector database by polling emails and Dropbox once a day.

Ideal For: Businesses needing an AI assistant with advanced automation, real-time data updates, and more dynamic integrations.

Premium Tier - Fully Autonomous AI Assistant (\$\$\$)

Functionality:

- **All Features from the Advanced Tier.**
- **Real-Time Voice Interaction:** Hands-free AI communication with live command processing.
- **Full System Integrations:** Seamless connectivity with all enterprise tools and platforms.
- **Custom Analytics Dashboard:** Tracks AI interactions, efficiency, and user engagement.

Ideal For: Organizations requiring an autonomous AI assistant with real-time processing and complete workflow automation.

Additional Add-ons (*Available for any tier*)

- **Custom Front-End UI (\$1,500)** – A branded and customized interface tailored to specific business needs.
- **Self-Hosted n8n Setup (\$2,000)** – Deployment of n8n for self-hosted workflow automation.
- **Voice Model Integration (\$3,000)** – Attaching a conversational voice model to the assistant for hands-free interaction.
- **Continuous AI Model Training & Optimization (\$3,500/year)** – Ongoing updates and enhancements for better accuracy and functionality.

Key Factors to Consider in Pricing

A. Project Scope & Complexity

- **Solution Type:** A simple AI chatbot costs less than a multi-agent automation system.

- **Data Processing Needs:** Does it require custom data pipelines, fine-tuning LLMs, or integrating external APIs?
- **Automation Level:** Will it be a rule-based system, LLM-based agent, or a fully autonomous multi-agent framework?

B. Time & Resources Required

- **Development Hours:** How many hours will you and your team spend building it?
- **Testing & Iteration:** AI systems require multiple iterations for fine-tuning.
- **Ongoing Maintenance:** Will the client need long-term support and updates?

C. Infrastructure & API Costs

- **Cloud Hosting & Compute:** Costs for running inference, fine-tuning models, or deploying AI agents (AWS, GCP, Azure, etc.).
- **Vector Databases:** If using Pinecone, Weaviate, or ChromaDB, account for storage and query costs.
- **API Usage Fees:** OpenAI, Claude, Gemini, or Hugging Face APIs have per-call pricing.

D. Licensing & Compliance

- **AI Model Licensing:** If using proprietary models, factor in API subscription costs.
- **Regulatory Compliance:** If working with sensitive data (e.g., healthcare or finance), compliance costs for GDPR, HIPAA, or SOC2 may apply.

E. Client's Budget & Expected ROI

- **Budget Expectations:** Understand what the client is willing to pay.
- **Business Impact:** If your AI system saves the company \$500,000/year, your pricing should reflect that value.
- **Long Term Goals/Value:** Does the client have a bullish mindset around AI? Is there more work/opportunities here?

Common Pricing Mistakes to Avoid

- **Undercharging:** AI solutions provide massive value—don't sell yourself short.
- **Not Including Maintenance:** Factor in post-launch bug fixes and improvements.
- **Ignoring Infrastructure Costs:** API calls, vector DBs, and compute costs add up.
- **No Clear Pricing Tiers:** Offer different packages to fit various budgets.
