

Proposal for Client

Prepared for: Client

Prepared by: TrueHorizon AI

Date: January 22, 2025

1. Executive Summary

Objective: Implement AI-driven solutions for CLIENT to:

1. Integrate the Eleven Labs voice model with a Retrieval-Augmented Generation (RAG) system for dynamic knowledge base updates and enhanced functionality.
2. Enable non-technical staff to query complex SQL databases through natural language.

Value Proposition: The proposed solutions will streamline voice model automation and data accessibility, reducing manual workload and enabling faster decision-making. Both projects will support compliance and future scalability while leveraging existing infrastructure.

High-Level Scope:

- **Project 1:** Eleven Labs Voice Model with RAG
 - Integration of automated web scraping for dynamic updates.
 - RAG implementation to enhance the knowledge base with real-time information from <https://CLIENToberhausen.com/>.
- **Project 2:** Natural Language to SQL Solution
 - Development of a chat-based interface for querying complex SQL databases.
 - Data joining across multiple systems to deliver accurate results.

2. Background & Requirements

2.1 Company Overview

Industry: Entertainment and leisure, operating CLIENT venues across Europe.

Data Infrastructure: Extensive SQL databases hosted on Azure in the CLIENT region.

AI Initiatives: Transitioning into AI/LLM solutions for operational and customer experience enhancements.

2.2 Challenges

1. **Eleven Labs Voice Model with RAG:**
 - Manual content uploads for the voice model limit scalability.

- Need for automated knowledge base updates from the company's website.
- Couple of additional API integrations needed.

2. **Natural Language to SQL Solution:**

- Manual SQL queries by experts are time-intensive and prone to error.
- Complex data structures with no natural joins, making queries challenging for non-technical staff.
- Limited ability for real-time insights.

2.3 Project Requirements

Functional Requirements:

- **Eleven Labs Voice Model with RAG:**
 - Automated web scraping and vector database updates from the base URL of <https://CLIENT>
 - Integration with the existing Eleven Labs voice model for real-time knowledge retrieval.
 - External API capabilities.
- **Natural Language to SQL Solution:**
 - Chat interface for non-technical staff.
 - Advanced query handling, including joins across disparate systems.
 - 90%+ accuracy in query responses, matching existing expert performance.

Compliance Requirements:

- Adherence to GDPR with anonymized or dummy data for development.
- Secure handling of all customer and operational data.

Infrastructure:

- Azure SQL database hosted in the CLIENT region.
- ElevenLabs for Voice Agent creation and hosting
- N8N for process automation and system connections.
- Pinecone or Supabase for Vector Database

3. Implementation Tiers

Dynamic RAG Voice Agent

Tier 1: Core Functionality (\$4,250)

- ElevenLabs Voice Model
- Web scraping for dynamic, automated knowledge updates (every 24 hours)
- Automated vectorization data pipeline
- RAG integration with n8n AI Agent
- Basic testing of embedding models, metadata tagging, and splitting methods

Tier 2: Enhanced Functionality (\$6,650)

Everything in Tier 1 plus:

- Advanced vectorization testing - LLMs & DB providers
- External API integrations - current date/time, check availability, create booking
- Containerized solution for custom deployment (on-prem or in cloud)
- Azure VM deployment

Add-ons:

None apply

4. Next Steps & Sign-Off

Next Steps:

1. **Review Proposal:** CLIENT to review and provide feedback.
2. **Approve Scope:** Confirm project scope and select desired implementation tiers.
3. **Sign Agreement:** Formalize the agreement to begin work.
4. **Project Kickoff:** Start implementation as per the agreed timeline.
